RESEARCH FIELDS

- Traditional and advanced machining operations, in particular developing fundamental studies on the variables that can be predicted by using the finite element simulation, such as forces, pressure, heat flux, temperatures, thermal phenomena at the tool – chip interface, tool wear and residual stresses;
- Advanced empirical rheological models for hard materials such as AISI 52100 bearing steel, AISI H13 tool steel, AISI 316L stainless steels, Nickel based alloys (IN718, Waspaloy) and Aerospace Aluminum alloy (AA7075-T651)
- Study of surface integrity (residual stresses, white and dark layers, SPD, DRX and grain refinements) by numerical analysis and experimental tests;
- Influence of innovative cooling techniques (near-to-dry, N₂-Cryogenic, etc.) and their influence manufacturing processes for enhancing the Product Life and Performance
- Sustainable machining processes
- FEM-AI hybrid approaches for residual stresses optimization.
